

What do I want to learn or understand better?

The last weeks objective was to better assess the pace of the project, which I've partly achieved through communicating with the team, but since the scrum has not begun yet, it is difficult to improve further upon. I will continue to work on this objective in the following week. Some technology I (and the team) will need to learn (repeat) for next week are the use of GIT and basic coding for the Android platform. Since I have used GIT previously, there should not be any difficulties setting it up, some repetition on how to create branches and commit will be enough. As for the coding, I will read some articles on the internet as well as try to create a simple, runnable project in for example Android Studio (not sure if we will use this IDE).

How can I help someone else, or the entire team, to learn something new?

If the team needs help to learn the coding for Android, I believe we should each study and then collectively discuss what we've learned. If there is something in particular which I want the team to learn, I can demonstrate it with an example.

Scrum will start next week, no scrum exercises have been done this week.
