

Individual reflection week 3 - Hampus Ekberg

What do I want to learn or understand better?

As a group we now have a basic android application setup with data being saved on a remote database. Moving forward we will need to work on basic functionality like claiming ads and notifying the one who created the ad. To do this I need to research how to do this in an efficient manner.

How can I help someone else, or the entire team, to learn something new?

As I have spent some time researching databases and connected our application to a database I should be able to help the team work with the database.

What is my contribution towards the team's use of Scrum?

As a team we have been slacking a bit when it comes to using Scrum this week. I think it is important for us to have a better plan for how the application should work and look. Right now it feels a bit overwhelming to take a task, because doing any task also involves design and architecture of code. This would be better with a more detailed plan.

What is my contribution towards the team's deliveries

During this sprint I have worked on connecting the application to a remote database. Currently we have very basic functionality where all the ads are saved remotely, but in the future it would be nice to work with more advanced features of firebase to implement real-time updates and notifications.
